

GC HS-20 NX/Nexis[™] GC-2030

Analysis of Residual Solvents in Pharmaceuticals by Water-Insoluble Samples Using H₂ Carrier (USP 467)

Y. Mikota, E. Kobayashi, A. Miyamoto

User Benefits

- The use of H₂ as a carrier gas, which is inexpensive and easy to obtain, contributes to cost reduction in the laboratory.
- H_2 carrier gas is used to achieve the accuracy required by the USP.
- A hydrogen sensor ensures H_2 carrier gas can be used safely.
- Using a state-of-the-art HS-20 NX headspace sampler enables reliable measurement of residual solvents in pharmaceuticals.

Introduction

Test methods for residual solvents in pharmaceuticals are specified in the USP (United States Pharmacopeia) General Chapter <467> Residual Solvents, which mainly specifies using the headspace GC method. Residual solvents in pharmaceuticals are classified into Classes 1 to 3 based on potential risks to human health and strictly controlled accordingly. Sensitive analysis is required. The carrier gas generally used for analysis is He, but the depletion of He has become a problem recently. Consequently, there is a need for using an alternative carrier gas such as H₂ for analysis. Any method changes, such as substituting He with an alternate carrier gas, must be validated according to USP Chapter <1467> Residual Solvents—Verification of Compendial Procedures and Validation of Alternative Procedures.

This paper presents the results of using H₂ as a carrier gas with an HS-20 NX headspace sampler to analyze Class 1 and 2 water-insoluble samples in accordance with USP General Chapter <467> Residual Solvents.

* Analytical samples were prepared using a different procedure from the USP to confirm the performance of the apparatus.

Instrument Configuration and Analysis Conditions

A Nexis GC -2030 gas chromatograph and Shimadzu HS-20 NX headspace gas sampler were connected to measure the listed Class 1 and Class 2 standard solutions according to USP General Chapter <467> Residual Solvents, Procedure A. The analytical conditions for GC and HS are indicated in Table 1.

GC Analysis Conditions (Procedure A)					
Nexis GC-2030					
FID-2030 flame ionization detector					
SH-Rxi™-624 Sil MS					
(0.32 mm l.D.×30 m, d.f.= 1.8 μm)					
40 °C (20 min) – 10 °C/min – 240 °C (20 min)					
Total 60 min					
Split 1:5					
Constant linear velocity mode (H ₂ and He)					
35 cm/sec					
250 °C					
32 mL/min					
24 mL/min (N ₂)					
200 mL/min					
HS Analysis Conditions (Procedure A)					
80 °C					
90 °C					
105 °C					
Off					
20 mL					
45 min					
1 min					
68.9 kPa (N ₂)					
0.5 min					
5 min					
1 mL					
0 min					

Analysis of Class 1 Standard Solution (Water-Insoluble Sample)

The analysis results for Procedure A using a H_2 carrier are shown in Fig. 1. The S/N ratio and repeatability values for each peak are shown in Table 2. Table 3 shows the S/N ratio and repeatability values for each peak when using a He carrier as a reference.

Using a $\rm H_2$ carrier, the results obtained with Procedure A satisfied the requirements of the USP, which specifies that "the S/N ratio for 1,1,1-trichloroethane in the Class 1 standard solution is not less than 5. "

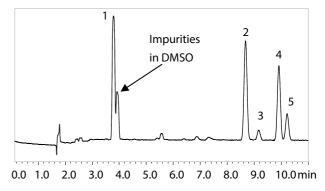

Fig. 1 Chromatogram of Class 1 Standard Solution by Procedure A (Water-Insoluble Sample)

 Table 2 S/N Ratio and Repeatability of Class 1 Standard Solution

 (Procedure A) Using H₂ Carrier

Peak No.	Compound	S/N Ratio ^{*1} (n=4)	%RSD*1 (n=4)
1	1,1-Dichloroethane	201	1.70
2	1,1,1-Trichloroethane	211	1.30
3	Carbon tetrachloride	21	4.82
4	Benzene	155	0.81
5	1,2-Dichloroethane	61	0.15

Table 3 S/N Ratio and Repeatability of Class 1 Standard Solution (Procedure A) Using He Carrier

Peak No.	Compound	S/N Ratio ^{*1} (n=4)	%RSD*1 (n=4)
1	1,1-Dichloroethane	227	1.53
2	1,1,1-Trichloroethane	175	0.92
3	Carbon tetrachloride	17	0.82
4	Benzene	150	0.75
5	1,2-Dichloroethane	65	0.67

*1 The S/N ratio and relative standard deviation (%RSD) values are reference values and not intended to be guaranteed values.

■ Conclusion

Using a H₂ carrier gas, the analysis achieved the accuracy levels required by USP Chapters <467> and <1467>. The Nexis GC-2030 features a hydrogen sensor to ensure safe H₂ usage. Hydrogen sensors detect potential leaks early. When hydrogen Nexis is a trademark of Shimadzu Corporation in Japan and/or other countries. leakage increases, the main power supply is switched off to prevent accidents. Using a H₂ carrier can help reduce lab costs. For information about using a N₂ carrier for analysis of residual solvents in pharmaceuticals using water-insoluble samples, refer to Application News No. G326.
