# **AUTOMATING SAMPLE PREPARATION FOR THE GC ANALYSIS OF BIODIESEL USING METHOD EN14105:2011** Anthony Macherone and James McCurry, Agilent Technologies, Wilmington DE, USA

## Introduction

In countries adhering to European Union norms, B100 biodiesel quality is assured by measuring the amount of free and total glycerol and the mono-, di-, and triglycerides contained in the fuel. A gas chromatography (GC) method, EN14105, was developed to separate and quantify these compounds. Since glycerol, mono-, and diglycerides are not volatile, the method outlines a complex procedure to derivatize these compounds and create volatile species prior to GC analysis. In 2011, the European Committee for Standardization (CEN) updated this method to improve GC performance, glyceride quantification, and overall precision.[1] This work describes using the Agilent 7696A WorkBench to automated the preparation of calibration standards and samples for analysis with the Agilent 7890A GC.

The Agilent 7696A Sample Prep WorkBench is a standalone instrument specifically designed to perform automated sample preparation. It uses two 7693A injection towers to volumetrically transfer liquids between 2-mL vials. Vials containing various chemical resources, standards, and samples are housed in three 50-positions trays. The sample tray compartment contains a robotic arm, a vortex mixing station, and a sample heating station.

# **WorkBench Preparation of Calibration Standards**

The EN14105 method requires the preparation of 5 calibration standards using a linear dilution technique. Four standards contain different amounts of glycerol and the same amount of the internal standard 1,2,3-butanetriol. The fifth calibration standard contains three monoglycerides used to identify these compounds in biodiesel by retention time comparison. The EN14105 method outlines the steps used to manually prepare approximately 10-mL of each calibration standard. Since the WorkBench uses 2-mL vials, automating the method required a volume reduction by a factor of ten. Shown below are the individual steps used to prepare the calibration standards using the WorkBEnch software.

### WorkBench Preparation of Biodiesel Samples

The EN14105 method calls for weighing 100 mg of biodiesel sample into a reaction vial for derivatization. Since the WorkBench sample prep scale was reduced by a factor of ten, only 10 mg of sample was weighed into 2-mL high recovery vials. Automatic sample weighing cannot be performed using the WorkBench because there is no analytical balance. Weighing 10 mg of biodiesel was done by manually pipetting 11.5 uL of biodiesel into tared 2-mL high recovery vials and recording the weight to the nearest 0.01 mg.

Sample preparation for the EN14105 method is performed by adding fixed volumes of the butanetriol stock, the standard glycerides stock, pyridine, and MSTFA to the sample to derivatize the non-volatile components. After the 15 minutes, heptane is added to the mix to quench the reaction. Since 2-mL vials were used for the WorkBench, the volumes of each added reagent was reduced by a factor of ten. The individual steps for this sample preparation are shown below.

### GC Analysis of WorkBench Prepared Biodiesel Samples

### Summary and Conclusion

The Agilent 7696A WorkBench successfully an automated the preparation of standards and samples for the revised European Union method EN14105:2011. Since the WorkBench uses 2-mL vial, the scale of the EN14105 preparation was reduced by a factor of 10. This served to lower reagent costs and reduced the generation of waste chemicals when performing this analysis. Calibration standards prepared with the WorkBench met all performance criteria set forth by the method. Ten duplicates of a biodiesel sample were prepared using the WorkBench and the resulting GC analysis showed extremely high precision that exceeded the requirement of the EN14105 method.
